

THE PROBLEM

Healthcare adoption signals are **public** but **invisible**

GTM and strategy teams discover account readiness manually, late, or not at all
— long after a buying window has opened.

-  Signals are scattered across hospital websites, job boards, clinical trial registries, press releases, and conference proceedings
-  By the time readiness is obvious in CRM or static datasets, the window is already closing
-  No existing tool aggregates live public web signals into ranked, actionable account intelligence

Signal sources — all fragmented

Hospital websites

Job postings

ClinicalTrials.gov

Press releases

Physician profiles

Conference activity

Regulatory filings

Market news

These signals appear **6–18 months** before formal buying intent — but only if you're watching.
